Originated by the French mathematician Rene Thom in the 1960s, catastrophe theory is a special branch of dynamical systems theory. It studies and classifies phenomena characterized by sudden shifts in behavior arising from small changes in circumstances.

The Toba catastrophe theory holds that this event caused a global volcanic winter of six to ten years and possibly a 1,000-year-long cooling episode. In 1993, science journalist Ann Gibbons posited that a population bottleneck occurred in human evolution about 70,000 years ago, and she suggested that this was caused by the eruption.

Catastrophe theory was the first mathematical "advance" to receive extensive coverage in the popular press since quantum mechanics. The interest and adulation afforded to chaos theory and nonlinear dynamical systems research barely imitated the enthusiasm and later scorn generated by Thom and his followers.

After the dimensionless state variables of each hierarchical level are processed, the total catastrophe progression value of the evaluation object is calculated and determined, according to the mathematical model of the corresponding catastrophe theory types and the principle of "complementarities" and "non-complementarities (Wen & Chen, 2016).
