A realistic picture of underwater sound transmission between a source and a receiver is strongly influenced by the acoustic properties of the communication channel formed by the sea. Beside the strong influences on sound propagation arising from the inhomogeneous channel boundaries, the sea surface and bottom, also the volume inhomogeneities of the channel contribute considerably, and

Cavitation bubble dynamics - ScienceDirect

The dynamics of cavitation bubbles on water is investigated for bubbles produced optically and acoustically. Single bubble dynamics is studied with laser produced bubbles and high speed photography with framing rates up to 20.8 million frames per second.
