Researchers synthesize recombinant proteins in cell-free extracts to verify the identity of cloned genes, to study protein-protein, protein-nucleic acid, and protein-drug interactions, and to carry out mutagenesis studies. In vitro protein translation studies rely on the efficient and selective

[Cell-Free Translation Systems | A.S. Spirin | Springer](#)

This is a unique book that describes the most recent achievements in the methodology of protein biosynthesis under cell-free conditions. Various versions of cell-free protein-synthesizing systems and their applications to production of individual proteins on a preparative scale are reviewed.

[3 Cell-Free Expression Systems Protein - Promega](#)

Origins of Cell-Free Expression Systems Cell-free protein expression lysates are generated from cells engaged in a high rate of protein synthesis, such as immature red blood cells (reticulocytes). The most frequently used cell-free expression systems originate from rabbit reticulocytes, wheat germ and E. coli. There are two types of cell-free expression systems: Translation Systems and Coupled EP2216414A1 - Cell-free translation system - Google Patents

The present application relates to a cell-free translation system comprising a nonsense-codon suppressing agent and an anti-release factor antibody which precipitates and/or crosslinks a release factor in said cell-free translation system. Also, this application relates to the use of such a cell-free translation system for the production of an

In this context, a reconstituted cell-free translation system that only contains the essential factors for protein synthesis is ideal to evaluate the role of chaperones, because the cell-free system is chaperone-free. Therefore, we chose an E. coli reconstituted cell-free system.

Cell-free translation also allows the introduction of a fluorescent label into the N-terminus of expressed proteins using a fluorescent-labeled initiator Met-tRNA (5, 6). The incorporated fluorescent label can be used for quantification or activity measurement of mutated proteins without the need for purification.
