## Soil Health - Fertility

Soil fertility is the combined effect of three major interacting components, the chemical, physical and biological characteristics of the soil. The physical and chemical characteristics of soil are far better understood than that of the biological component, therefore we know quite a lot about the desired chemical and physical status of soils. It is still difficult to define the desired Soil fertility - Wikipedia

Soil fertility can be severely challenged when land use changes rapidly. For example, in Colonial New England, colonists made a number of decisions that depleted the soils, including: allowing herd animals to wander freely, not replenishing soils with manure, and a sequence of events that led to erosion.
