### [Insect olfaction - Wikipedia](#)

Insect olfaction refers to the function of chemical receptors that enable insects to detect and identify volatile compounds for foraging, predator avoidance, finding mating partners (via pheromones) and locating oviposition habitats. Thus, it is the most important sensation for insects. Most important insect behaviors must be timed perfectly.

[Insect Olfaction: A Map of Smell in the Brain](#) Humans use three classes of photoreceptor to span the visible spectrum, but smell relies on hundreds of distinct classes of olfactory receptor neuron. Even the simple fruitfly has around 50 classes of olfactory receptor neuron. Two new studies map the projections of the great majority of these neurons into stereotyped positions in the fly brain.

Abstract. Great progress has been made in the field of insect olfaction in recent years. Receptors, neurons, and circuits have been defined in considerable detail, and the mechanisms by which they detect, encode, and process

sensory stimuli are being unraveled.

**Insect Olfaction as a Natural Blueprint of Gas Sensors?**

insect depends on many internal and external variables, and hunger is one of the most important internal ones.

Next, different behaviors are mutually exclusive.
