 We consider the following classical urn-problem. Suppose that there are  $71$  urns given, and that balls are placed at random in these urns one after the other. Let us suppose that the urns are labelled with the numbers  $1, 2, \dots, n$  and let  $t_j$  be equal to  $k$  if the  $j$ -th ball is placed into the  $k$ -th

[probability theory - an overview | ScienceDirect Topics](#) Probability theory specifies parameters and a model and then examines a variable outcome, whereas statistics takes the data, assumes a model, and then tries to infer the system properties, given the model. Parameters are key descriptors of the stochastic system. In statistics, there are two main views about how one should learn about the parameter values in a stochastic system: classical (also [7 Probability Theory and Statistics](#)
