Abstract: Nonequilibrium phase transitions are discussed with emphasis on general features such as the role of detailed balance violation in generating effective (long-range) interactions, the importance of dynamical anisotropies, the connection between various mechanisms generating power-law correlations, and the emergence of universal

Turbulence as a nonequilibrium phase transition
the laminar to the turbulent flow is analogous to nonequilibrium phase transitions in many other physical systems. The "order parameter" -- the Reynolds stress -- can be found by minimizing a functional that recalls the Landau functional.
