[Deformation \(mechanics\) - Wikipedia](#)

Deformation in continuum mechanics is the transformation of a body from a reference configuration to a current configuration. A configuration is a set containing the positions of all particles of the body. A deformation may be caused by external loads.

Material nonlinearity involves the nonlinear behavior of a material based on a current deformation, deformation history, rate of deformation, temperature, pressure, and so on. Examples of nonlinear material models are large strain (visco) elasto-plasticity and hyperelasticity (rubber and plastic materials).

Nonlinear Wave Transformation over a Submerged Triangular ...

A numerical model is developed to predict nonlinear wave transformation over and around the breakwater on the basis of fully nonlinear wave equations proposed by Isobe (1994). Laboratory experiment has also been conducted in a wave basin. The validity of the numerical model is examined by comparing the computations with the measurements. 1. Introduction When waves propagate over a submerged

Weakly nonlinear waves in a linearly tapered elastic tube ...

In the present work, treating the arteries as a tapered, thin-walled, long and circularly conical prestressed elastic tube and using the long-wave approximation, we have studied the propagation of weakly nonlinear waves in such a fluid-filled elastic tube by employing the reductive perturbation method.
