- [2018 SOLIDWORKS Help - When to Use Nonlinear Analysis](#)
- When to Use Nonlinear Analysis Linear analysis is based on the static and linearity assumptions and is, therefore, valid as long as these assumption are valid. When one (or more) of these assumptions fails, linear analysis will produce wrong predictions and nonlinear analysis must be used to model the nonlinearities.

Problem with nonlinear curve fitting - lsqcurvefit ...

I'm trying to fit a nonlinear curve with constraints, so I use lsqcurvefit to get the parameters of my function. After applying lsqcurvefit I obtain this output: Local minimum possible. So I use MultiStart in order to get the global minimum, but it is not able to obtain the parameters of the function

Principles of affinity in nonlinear problems

When we investigate specific problems of nonlinear analysis, we often use equations that are different in principle. For instance, when seeking the conditions for oscillation of a nonlinear system, we either try to find the fixed points of the Poincaré-Andronov operator that acts in the phase space of the system or seek the solutions of different equivalent integral equations considered in
