Mechanism of alternative splicing and its regulation
Alternative splicing of precursor mRNA is an essential mechanism to increase the complexity of gene expression, and it plays an important role in cellular differentiation and organism development. Regulation of alternative splicing is a complicated process in which numerous interacting components

[Alternative splicing - Wikipedia](#)

Alternative splicing, or differential splicing, is a regulated process during gene expression that results in a single gene coding for multiple proteins.

[Mechanisms of alternative splicing regulation: insights ...](#)

Alternative splicing is a crucial mechanism for gene regulation and for generating proteomic diversity. Recent estimates indicate that the expression of nearly 95% of human multi-exon genes involves alternative splicing 1, 2. [Regulation of Alternative Splicing: More than Just the ABCs](#)

Abstract. Alternative pre-mRNA splicing, the differential inclusion or exclusion of portions of a nascent transcript into the final protein-coding mRNA, is widely recognized to be a ubiquitous mechanism for controlling protein expression.

[Alternative splicing: A novel mechanism of regulation ...](#)

Alternative splicing (AS) of precursor messenger RNA (pre-mRNA), a process allowing multiple mRNA transcripts to be generated from a single gene, is an important mechanism used for the generation of proteomic diversity and the regulation of gene expression in eukaryotic organisms .

[REGULATION OF ALTERNATIVE SPLICING | Request PDF](#)

Alternative splicing is a process in which more than one isoform of mRNA can be produced from one pre-mRNA. Quite complex regulatory mechanisms decide which isoform is produced in a given case.

[What is Alternative Splicing, and Why is it Important ...](#)

Alternative splicing is known to be involved in the regulation of normal physiological functions as well as pathologies. For example, a number of alternatively spliced genes in immunity are known. Studies indicate that alternative splicing of CD44, a protein involved in T cell homing with 10 variable cassette exons and six distinct protein isoforms, is crucial for T cell function. The variable

Regulation of Alternative Splicing by Histone Modifications

Alternative splicing of pre-mRNA is a prominent mechanism to generate protein diversity, yet its regulation is poorly understood. We demonstrated a direct role for histone modifications in alternative splicing.

Alternative RNA Splicing in Evolution | Jon Lief, M.D.

Alternative RNA splicing in evolution is one of the critical factors in the development of the complexity of human beings. Previous posts have shown how the shapes of complex interlocking proteins allow the neuron machinery to process mental events. The shapes of the proteins are determined by the

The alternative role of DNA methylation in splicing regulation

DNA methylation is emerging as an important factor for both exon selection by the splicing machinery and for the regulation of alternative splicing. In the equal exon-intron GC-content group, the presence of CG dinucleotides at specific positions in the 3' splice site and the 5' splice site is correlated with a very high level of DNA methylation (almost 100%) compared to the methylation
