[Senile Dementia - Symptoms, Diagnosis and Treatment](#)
Senile dementia is a disease caused by degeneration of the brain cells. It is different from normal senility in the elderly in that the patient's brain function will gradually deteriorate resulting in progressive loss of memory and mental abilities, and noticeable personality changes.

[Senile Dementia | Fisher Center for Alzheimer's Research ...](#)
Senile dementia is the mental deterioration (loss of intellectual ability) that is associated with old age. Two major types of senile dementia are identified: those due to generalized atrophy (Alzheimer s-type dementia) and those due to vascular problems (mainly, strokes). Senile dementia is often used when referring to Alzheimer s disease.

Dementia is a general term for loss of memory and other mental abilities severe enough to interfere with daily life. It is caused by physical changes in the brain. Alzheimer's is the most common type of dementia, but there are many kinds.

[Alzheimer's disease - Wikipedia](#)

Alzheimer's disease (AD), also referred to simply as Alzheimer's, is a chronic neurodegenerative disease that usually starts slowly and worsens over time. It is the cause of 60-70% of cases of dementia. The most common early symptom is difficulty in remembering recent events (short-term memory loss). As the disease advances, symptoms can include problems with language, disorientation
