Sheet metal forming processes are those in which force is applied to a piece of sheet metal to modify its geometry rather than remove any material. The applied force stresses the metal beyond its yield strength , causing the material to plastically deform, but not to fail.

INTRODUCTION TO SHEET METAL FORMING PROCESSES

A sheet formed part is usually obtained through a number of operation (phases) final surface intermediate surface Each operation can be decomposed in several phases. It may be necessary to model each of them Gravity fall Holding Forming Trimming, flanging Springback Most problems in sheet metal forming come from a bad control of holding, restraining and springback.
