In physics, a shock wave (also spelled shockwave), or shock, is a type of propagating disturbance that moves faster than the local speed of sound in the medium.

[Shock wave | physics | Britannica.com](#)

Shock waves differ from sound waves in that the wave front, in which compression takes place, is a region of sudden and violent change in stress, density, and temperature. Because of this, shock waves propagate in a manner different from that of ordinary acoustic waves.

[What is the speed of a shock wave? - Quora](#)

Shock waves do not follow the normal rules for sound propagation due to the intense pressure differentials that are created. When the pressure wave is created by a supersonic event, the downstream molecules do not have enough time to get out of the way, and pile up into a very thin layer of high density.
