Just like how your left foot doesn't quite fit your right shoe, molecules also can have properties that depend on their handedness! This property is called chirality. We will go over what makes a molecule chiral, stereoisomers, assigning configurations using the R,S system, optical activity and Fischer projections.

[Tacticity - Wikipedia](#)

Tacticity (from Greek *taktikos* "of or relating to arrangement or order") is the relative stereochemistry of adjacent chiral centers within a macromolecule. The practical significance of tacticity rests on the effects on the physical properties of the polymer.

[Stereochemistry tutorial: Enantiomers and Diastereomers](#)

All chiral molecules have nonsuperimposable mirror images. And as a general rule of thumb, chiral molecules must have one or more chiral centers -- that is, carbons that have four non-identical substituents around it.
