Interest in the biological effects of ionising radiation closely followed the identification of such radiation. The realisation that DNA is the site of genetic information in cells subsequently focussed attention on DNA as an important target in the lethal and mutagenic effects of ionising radiation.

Side effects will depend on the area where radiation therapy is given. Sometimes the whole brain is treated with radiation, although the doses are often lower. High doses of radiation therapy to the brain are more likely to cause long-term problems. In children, the younger the child, the more sensitive the brain cells are to the side effects of radiation.

Early effects of radiation 1. Dr Muhammad Salman Khan 2. Radiation has been described as a double-edged sword. On the one hand, radiation itself is a useful tool for research; medical diagnosis and therapy and on the other hand, radiation exposures, especially at high levels, can lead to increased frequencies or severities of various adverse health effects. 3. To produce a radiation response in

Like UVB, ionizing radiation causes direct DNA damage that lead to mutations. Exposure ionizing radiation leads to double-stranded breaks in DNA, so both parts of the DNA molecule are broken at the same spot. This type of breakage is repaired by the cell by reattaching the DNA strands together.
